

KOIKE LEVEL GAUGE

Koike Air Breather Level Gauge

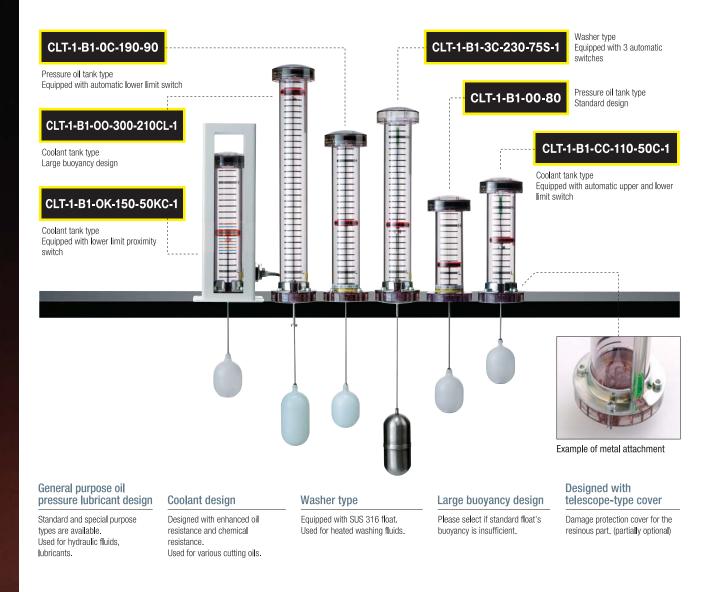

Attached to the tank top with excellent visibility, the fluid level can be checked at a glance from any direction.

Highly useful level gauge with "fine visibility" and "little trouble."

The level gauge body can be installed on the top of a tank, greatly improving the level visibility. Free from error operation due to magnetic materials or fluid leakage from damage on a manufacturing site.

Characteristics of Clean Level Tower

From any direction in 360°

The level tower can be installed on the tank top, allowing to check the changing fluid level from any direction. Effective for speeding up oil supply operation or preventing fluids from overflowing.

Optimal level gauge

An optimal level gauge can be made to order according to the type, depth, or used fluids requested by customers.

Easy installation

Easy installation with 4 screws. The sensor (automatic switch, proximity switch) can be installed easily, allowing centralized control of fluid levels.

Air breather function

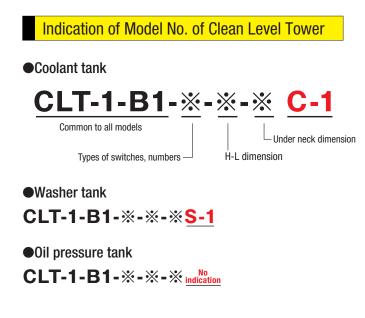

An air bleeding mechanism is installed in the level gauge for oil pressure and hydraulic fluid tank types. Effective for preventing corrosion by releasing the heat or steam in the tank.

Prevention of error operation

Only a float is placed in the tank. Since a magnet detector is installed towards the tank top, error operation trouble due to magnetic sludge can be prevented.

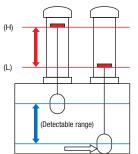

Dimensions of Clean Level Tower

H-L dimension

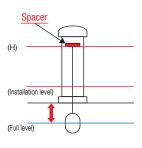

OH-L dimension means detectable range.

OIndicates the upper limit (H) and lower limit (L) of fluid level in the tank.

OH-L dimension is between 30 and 930 mm, and the tower can be manufactured according to the depth of the tank used by a customer.

* Standard manufacture is designed in 10-mm increments, but special order in 5-mm increments is also possible.

OWhen setting the lower level limit, take care so that the lower half of the float on the fluid level does not contact the tank bottom.

•Under neck dimension OIndicates the distance between the installation level (tank top) and full tank level.

- OThe upper limit is the level of the under neck dimension setting down from the installation level, with the spacer indicating (H).
- OThe minimum under neck dimension is 50 mm. Manufacturer is possible within the range of 50 to 300 mm.
 - * Standard manufacture is designed in 10-mm increments, but special order in 5-mm increments is also possible
 - * Since a large float is used for the washer type (S-1), the minimum dimension is 70 mm.

Switch types of Clean Level Tower

Automatic switch

Switch manufacturer	Туре	Specifications	Visual contact	Lower limit	Upper and lower limit	3 switches	4 switches
SMC	D-Z73L	A contact	00	OA	AA	3A	4A
	D-Z73L-100	B contact	00	OB	BB	3B	4B
JPN	SWC-1-G	B contact	00	OC	СС	3C	4C

Proximity switch

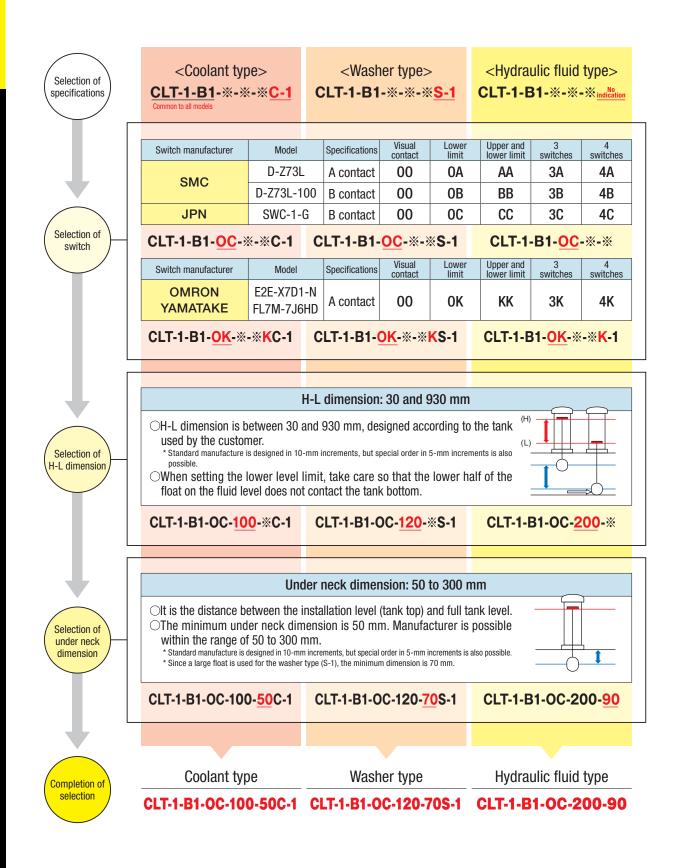

Switch manufacturer	Туре	Specifications	Visual contact	Lower limit	Upper and lower limit	3 switches	4 switches
OMRON	E2E-X7D1-N	A contact	00	ОК	КК	ЗK	4K
YAMATAKE	FL7M-7J6HD						

Float types of Clean Level Tower

Selection can be made according to the used fluid type, temperature, gauge dimension, buoyancy, and other specifications.

ø50 H65 Polypropylene	ø50 H95 Polypropylene	ø50 H110 SUS316	ø95 H95 SUS316
W50-001	W50-003	W50-002	W95-001
Standard float type with enhanced oil resistance and chemical resistance. Applicable to room temperature fluids. Suitable for various cutting oils.	Please select if the buoyancy of W50-001 is insufficient. Be sure to use without fail in case the stroke of the level gauge is 500 mm or over.	SUS float type with excellent resistance to oil, chemical and even strong alkaline. Applicable up to fluid temperature at around 70°C. Most suited for heated washers.	Please select if the buoyancy of W50-002 is insufficient. Be sure to use without fail in case the stroke of the level gauge is 800 mm or over.

Selection procedure of Clean Level Tower

The specifications and designs are subject to change without advance notice. Please contact first.
